INSTALLATION MAINTENANCE AND OPERATING INSTRUCTION

1. Purpose

This instruction manual describes how to install, operate and maintain CWT strainer.

2. Application

The strainer should only be used for the conditions as specified in the data sheet, i.e. working condition and liquid details. In addition it has been designed for using with industry recognized cleaning solutions.

3. Installation

Each Strainer is shipped completely assembled and ready for installation. Please pay attention to the correct location of the "INLET TAG" to make sure that the unit is properly aligned prior to bolting up in the field. Check the hold down lugs at closure to ensure a proper seal will be maintained during the operation of the unit. For units with bolted covers, check to ensure all nuts are tight.

4. Operation

During operation, once proper installation has been accomplished, the units require special monitoring. The pressure differential across the strainer must be observed periodically to determine when the filter becomes sufficiently loaded with solids to warrant the cleaning of the filter. The maximum acceptable differential across the filter should be determined and preset prior to operation to ensure trouble free operation.

5. Maintenance

Should it be necessary to open the cover of the strainer, to remove or replace the filter, care must be taken to ensure that the pressure inside the unit has been released to atmosphere. Each hold-down lug on the closure should be loosened halfway, i.e. not removing the swing bolt from its position, until the line fluid begins to seep out which ensures that the line pressure has been released. For units with bolted covers, loosen each nut slightly, before completely removing.

When placing the filter into the straining unit, care must be taken to ensure that the filter is properly seated. Before closing the cover, the machined surface which will contact the O-ring must be thoroughly wiped clean to minimize scoring on the O-ring. The O-ring itself should also be inspected to ensure that proper sealing will be accomplished. Once closed the hold-down bolts should be tightened to ensure that the cover and O-ring rest squarely on the seating surface. The same care must be taken for the bolted cover design strainers that have flat gaskets.
